Carcinogenicity	<i>No data available</i>	<i>Not classified because of "A"</i>
Reproductive toxicity	<i>No data available</i>	<i>No data available</i>
Specific target organ toxicity(single exposure)	<i>Although it was reported that in the case of intratracheal instillation to rats, proliferation of leukocytes and histiocytes with subsequent slight fibrosis were seen in the lungs, especially at the injection site (DFGMAK-Doc. 23 (2007)), no other data were available. Thus, "Classification not possible" was concluded due to lack of sufficient data.</i>	<i>It was set as category 3 (respiratory irritation) from the statement of upper respiratory irritation (ICSC (2000)).</i>
Specific target organ toxicity(repeated exposure)	<i>In the 70 days feeding study with rats, deaths were observed in the groups given at dietary concentration of 0.5% (converted dose level as that of 90-day study; approx. 194 mg/kg) and more, but only body weight loss was described at lower concentration of 0.1% (DFGMAK-Doc. 23 (2007)). In humans, it was reported that in the survey of workers with long industrial experience, no pneumoconiosis developed among those exposed to solely tungsten or its insoluble compounds (ACGIH (2001)). On the other hand, there was the report mentioning that symptom of pulmonary fibrosis was observed in the workers exposed to dust containing this substance (ATSDR (2005)). But, the report also described that the original data lacked critical information regarding the smoking history and past medical histories of workers examined. As described above, in spite of multiple hazard information, these were insufficient to use properly as evidence to classify. Therefore, the classification was concluded as "Classification not possible".</i>	<i>It was classified into Category 1 according the statement that by occupational exposure of aluminas, pulmonary fibrosis was occurred (EHC (1997)).</i>
Aspiration hazard	<i>No data available</i>	<i>No data available</i>
Other information	<i>No data available</i>
