<p>Specific target organ toxicity(single exposure)</p>	<p>From the knowledge in humans in EHC (1998), ACGIH (7th, 2001), and ATSDR (2004), respiratory symptoms (respiratory tract irritation) are the main acute toxic signs in the inhalation route. As for oral exposure, it is described that digestive symptoms (nausea, vomiting, abdominal pain, etc.) were observed after the ingestion of drinking-water and others containing high copper concentrations, and there are numerous reports that nausea and vomiting mainly occurred. Other than these, it is reported in EHC that inhalation exposure caused hepatomegaly, but the air levels were very high, and it is described in ATSDR that liver lesions from acute copper poisoning are rare except for specific diseases (Wilson's disease, etc.). Therefore, the liver was not included in the target organs, and it was classified in Category 1 (digestive system), Category 3 (respiratory tract irritation).</p>	<p>No data available</p>	<p>No data available</p>

Specific target organ toxicity(repeated exposure)	It is reported in EHC (1998), DFGOT vol. 22 (2006) that repeated oral exposure to copper in humans caused digestive symptoms (nausea, vomiting, abdominal pain, etc.) and liver disorder (hepatic failure, cirrhosis). Because digestive symptoms are nausea, vomiting, abdominal pain, etc., they cannot be regarded as specific target organ toxicity. Furthermore, hepatic failure is reported in only one case, therefore it was judged impossible to generalize it. From the above, it was classified as "Classification not possible."	No data available	There can cause conjunctivitis, headache, dizziness, insomnia, gastrointestinal disorders, blurred vision (methanol decomposition products:)
Aspiration hazard	No data available	No data available	No data available
Other information	The fluorine resin, which is an active ingredient, there may be generated toxic gas containing hydrogen fluoride is thermally decomposed slowly at high temperatures.
